

## AMENDMENT TO THE CLAIMS

1. to 33. (Canceled)

34. (New) An image processing apparatus comprising:

a capturing unit adapted to capture a reduction image from a storage medium storing storage images, the reduction images respectively corresponding to the storage images;

a first display control unit adapted to cause a display device to display the reduction images captured by said capturing unit;

a first selection indication unit adapted to select and indicate those reduction images which are to be subjected to a specific image process, from the reduction images displayed on the display device;

a second display control unit adapted to cause to sequentially display a larger size image for each of the reduction images indicated by said selection indication unit;

an execution indication unit adapted to select and indicate which of the storage images are to be subjected to the specific image process, by selecting a corresponding larger size image sequentially displayed by said second display control unit;  
and

a specifying unit adapted to specify as a group, as a target of the specific image process, the storage images corresponding to the larger size images indicated by said execution indication unit, upon completion of the display by said second display control

unit.

35. (New) An image processing apparatus according to claim 34, wherein said second display control unit performs a slide show display, and wherein the storage image corresponding to each of the reduction images selected by said selection indication unit is displayed as the larger image.

36. (New) An image processing apparatus according to claim 34, wherein said second display control unit causes the display device to display any one of the images to be displayed.

37. (New) An image processing apparatus according to claim 36, wherein said second display control unit causes the display device to further display an indication section for changing the image to be displayed on the display device.

38. (New) An image processing apparatus according to claim 34, wherein an application program corresponding to the specific image process automatically starts after the end of the display by said second display control unit.

39. (New) An image processing apparatus according to claim 34, wherein said execution indication unit can select whether or not to execute plural kinds of image processes.

40. (New) An image processing apparatus according to claim 34, wherein the specific image process includes a print process.

41. (New) An image processing apparatus according to claim 40, further comprising an editing operation accepting unit adapted to accept a user's operation to edit arrangements of the images to be printed and print sizes thereof in the print process.

42. (New) An image processing apparatus according to claim 34, wherein the specific image process includes an electronic mail transmission process.

43. (New) An image processing apparatus according to claim 42, further comprising an electronic mail formation control unit adapted to control to perform a new electronic mail formation process of attaching the image indicated to be transmitted as electronic mail, in the electronic mail transmission process.

44. (New) An image processing apparatus according to claim 34, wherein the specific image process includes a transfer process of transferring the storage image to a desired storage area.

45. (New) An image processing apparatus according to claim 34, wherein the storage medium is included in a digital camera.

46. (New) An image processing method comprising:

a capturing step of capturing a reduction image from a storage medium storing storage images and the reduction images respectively corresponding to the storage images;

a first display control step of causing a display device to display the reduction images captured in said capturing step;

a selection indication step of selecting and indicating those reduction images which are to be subjected to a specific image process, from the reduction images displayed on the display device;

a second display control step of causing to sequentially display a larger size image for each of the reduction images indicated in said selection indication step;

an execution indication step of selecting and indicating which of the storage images are to be subjected to the specific image process, by selecting a corresponding larger size image sequentially displayed in said second display control step, and;

a specifying step of specifying as a group, as a target of the specific image process, the storage images corresponding to the larger size images indicated in said execution indication step, upon completion of the display in said second display control step.

47. (New) A storage medium for computer-readably storing a program

to achieve an image processing method comprising:

a capturing step of capturing a reduction image from a storage medium

storing storage images and the reduction images respectively corresponding to the storage images;

a first display control step of causing a display device to display the reduction images captured in said capturing step;

a selection indication step of selecting and indicating those reduction images which are to be subjected to a specific image process, from the reduction images displayed on the display device;

a second display control step of causing to sequentially display a larger size image for each of the reduction images indicated in said selection indication step;

an execution indication step of sequentially selecting and indicating which of the storage images to be subjected to the specific image process, by selecting a corresponding larger size image sequentially displayed in said second display control step; and

a specifying step of specifying as a group, as a target of the specific image process, the storage images corresponding to the larger size images indicated in said execution indication step, upon completion of the display in said second display control step.

48. (New) A program for achieving, by a computer, an image processing method comprising:

a capturing step of capturing a reduction image from a storage medium storing storage images and the reduction images respectively corresponding to the storage

images;

a first display control step of causing a display device to display the reduction images captured in said capturing step;

a selection indication step of selecting and indicating those reduction images which are to be subjected to a specific image process, from the reduction images displayed on the display device;

a second display control step of causing to sequentially display the reduction images indicated in said selection indication step;

an execution indication step of selecting and indicating which of the storage images are to be actually subjected to the specific image process, by selecting a corresponding larger size image sequentially displayed in said second display control step; and

a specifying step of specifying as a group, as a target of the specific image process, the storage images corresponding to the larger size images indicated in said execution indication step, upon completion of the display in said second display control step.
